ADDS QUESTIONNAIRE

Vendor name: MedAvail Technologies Inc.

Contact information: Edward Rickert Edward.Rickert@quarles.com

1. In what specific patient care settings would this ADD be used? What are the security requirements for the remote location to ensure that medication access is limited only to authorized providers?

MedAvail Technologies can tailor the MedCenter pharmacy ADD to any patient care scenario, and as such, the MedCenter can be placed in a variety of secure patient care settings. For example:

- Hospital Emergency Departments, to service the prescription needs of patients discharged from said department
- Provider Clinics, including Urgent Care Clinics
- Ambulatory Surgical Centers
- Non-24-hour retail pharmacy settings, to extend their pharmacy services to the benefit of their patients
- Retail settings, to add pharmacy services where they currently do not exist
- Employer locations for staff access
- Long-term care facilities

The MedCenter is unique to pharmacy practice because it allows dispensing of medications from a robotic device, facilitated in real time by a pharmacist. Conventional systems are practitioner facing, whereas the MedAvail MedCenter is patient facing. Just as in a brick and mortar pharmacy, the remote pharmacist reviews the prescription and authorizes the dispensation of the medication according to the applicable state regulations. The remote pharmacists are granted access to the software via the servicing pharmacy.

2. How will the pharmacist review medication orders? Is there an interface or other method that allows for prospective review, or is review only retrospective?

All patient demographics, patient profile information, and insurance information are stored on the pharmacy management system employed by the servicing pharmacy. With this in mind, the call center pharmacy operating the system has access to all information it would have had the patient come to the pharmacy rather than the MedCenter, allowing for prospective review in real-time. The MedCenter can dispense pursuant to electronic prescriptions received at the operating pharmacy, or the patient can place hardcopy prescriptions into the integrated scanner on the MedCenter, which are viewed by the remote pharmacist via MedAvail's proprietary software, and can be retrieved and then stored in the pharmacy management system. Tools are available to the pharmacist to enhance their viewing of prescriptions if necessary.

3. What specific features are available through the technology to ensure that the correct medication was removed per the provider's medication order?

Predetermined quantities of each medication is prepackaged and logged by the servicing pharmacy or by a FDA registered repackager. There is no counting or packaging of any medication inside the MedCenter. Product verification prior to dispensing can be accomplished electronically, via bar

code technology, as well as by a review by the pharmacist. A 2D barcode is generated from an integrated software package, and is affixed to the package, identifying the medication, strength and dosage form, along with the lot number and expiration date. Human readable data is also printed on the label. All packaging and labeling is visible to and can be verified by a pharmacist prior to dispensing.

A human does not stock the MedCenter, per se. Rather, a human loads the packages to be stocked into an integrated load drawer. Upon closing the drawer, the robotics begin restocking the vault, reading each barcode and systematically placing the medications into slots within. The software will not allow the stocking of any package it does not recognize. If such an instance is encountered, the package will be discarded into a secure, integrated discard bin.

Upon processing a prescription by an authorized pharmacist, the MedCenter will pick only the package that was requested, and will validate the package's 2D barcode previously described. Additionally, photographs are taken of the before-and-after-labeled package, and are compared with each other, as well as with the original prescription facsimile and the prescription label, by the authorizing pharmacist. The pharmacist has the ability to reject the package for any reason if needed, and in doing so, it is placed in the aforementioned discard bin.

4. What are the security features of the technology? How is user access maintained and by whom? Who has the ability to remove medications?

From a physical standpoint, the device is made of 10-gauge steel, and upon installation, is bolted to floor. The touch screen, utilized for audio/video communication between the patient and the pharmacy personnel, is backed by metal to prevent any attempted penetration into the device.

The system has data and power monitoring systems, provided by MedAvail, against intrusion.

The deploying pharmacy utilizes MedAvail's proprietary software to configure personnel types and user identifications to grant privileges to access the physical device as well as to the software. Software access is gained via a user name and a password, whereas physical access to the various doors is gained via a card which is registered to the user in question, along with a personal identification number.

Physical access can be tracked via the assigned card, and access to specific doors is limited per the user type. Examples of specific doors include:

- Inventory Load Drawer
- Inventory Removal Door
- Labeler Door
- Main Service Door
- Printer Paper Door
- Prescription Storage Bin

The Main Service door is the only door that allows access into the medication vault. Access to that vault can be restricted to pharmacists only. None of the other access points allows contact with the stocked medications. Rejected medications from the discard bin can be reconciled with standard reports so as to avoid diversion.

Only the staff of the pharmacy deploying the MedCenter have access to the medications per their credentials, unless the medication is dispensed to the patient, in which case the patient removes it from the dispense bay door.

5. How are remote devices restocked? If the medication is transported after being checked by the pharmacist, what features are available that provide for detection of a tampered container?

Only members of the pharmacy deploying the MedCenter, with the appropriate credentials, can access the inventory load drawer. Upon closing the drawer, the robot optimally stocks the vault and knows where it places every package within its confines.

The products stocked in the dispenser are sourced from the pharmacy that operates the system. Tamper evident packaging could be used to alert the patient and the dispensing pharmacist to any problems.

MedAvail also provides a standard operating procedure that recommends utilizing a tote that is secured with uniquely numbered security seals to protect the contents of the container from tampering during transportation. An electronically generated manifest of the contents with signatures is to be placed inside the tote prior to its sealing. The person receiving the tote checks the contents thereof against the included manifest and validates the security seal numbers.

The medications placed in the MedCenter are electronically inventoried and a report is generated for pharmacist review. A record identifying the person who accessed the MedCenter to stock the dispenser is also created, so that any medications delivered to the MedCenter but not placed in inventory, as well as the person responsible for stocking, will be easily identifiable.

6. Can controlled substances be stocked? If so, what additional security features are available?

Controlled substances are not stocked at this time. MedAvail has engaged the DEA to address the dispensing of controlled substances. DEA has reviewed the technology and security, and are evaluating their regulations to determine next steps.

7. How would patient consultation occur?

Patient consultation with the dispensing pharmacist occurs real-time via the audio/video feed, while the MedCenter robotics are selecting the medication for labeling. This feature sets the MedCenter apart from other similar technology that allows only for telephone consultation, or no consultation at all.

8. How would the ADDS remote user interact with the pharmacist? What technology options exist?

There is an audio/video communication device on the front panel of the MedCenter that the patient activates by simply touching it. Doing so places a call to the pharmacist(s) on duty.

If the audio/video feed was to fail while a call is in progress, the pharmacist will call the telephone number associated with the MedCenter, and the patient can either pick up the handset, or converse hands-free per normal routine.

- 4186 can be revised to expand locations where a MedCenter type of device can be deployed to include appropriate patient care settings as identified above.
- 4186 also seems to require that the clinic own the inventory dispensed from the ADDS. This can be modified to clarify that the ADDS can be operated as an extension of the pharmacy, which dispenses medication from its inventory.

CA Bus. & Prof. Code § 4105.5

- This Code section incorporates the definition of an ADDS used in Section 1261.6 of the Health and Safety Code, which defines an “automated drug delivery system” as "a mechanical system that performs operations or activities, other than compounding or administration, relative to the storage, *dispensing*, or distribution of drugs". "Dispensing" is generally understood to mean deliver to the patient, as opposed to distribution, which generally means delivery to other than the patient, including to other practitioners. Accordingly, this statute contemplates the use of an ADDS to dispense directly to the patient.
- Based on the language of 4105.5, a patient facing ADDS can be used in a health care facility. However, to further support the use of this technology, 4105.5 can be amended to add requirements that address patient counseling, including the use of a real-time audio-video link between the patient and a California licensed pharmacist, DUR requirements, and other requirements to ensure safe, secure dispensing of medications, as noted above.
- 4105.5 can also be revised to expand locations where a MedCenter type of device can be deployed to include appropriate patient care settings as identified above.

Please submit completed questionnaire to Debbie Damoth by fax at (916) 574-8618 or by email at debbie.damoth@dca.ca.gov by **5 p.m. Feb. 10.**
